

BROWNtech, inc.

DOCUMENT MANAGEMENT & IMAGING SYSTEMS

(Including Land & Court records, Licenses, Notaries, Passports, etc.)

The system includes all the functions needed to receive documents, assign relevant numbers, imprint information on the document and/or create a bar coded coversheet, index, proof, scan, view, and fax them. It includes off-site access, complete with billing and receivables. It is a powerful system that grows and adapts as statutes change or as technology advances.

BROWNtech

We're accessible, we listen, we can get you there!

System Highlights

BROWNTech's Document Management & Imaging Systems

- ⇒ **Extensive Search Capabilities** - Extremely high hit rate due to our "intelligent" database, punctuation inconsistencies are eliminated (ABC, A.B.C., or A B C) all combinations are found regardless of how they were indexed. Search by name, book-page, document #, property address, certification #, and more. Optional "wildcards" ('?' and '*') can be substituted for unknown character(s), for example "Johns?n" or "Temple*".
- ⇒ **PC Network WIN 95/NT/2000** - Our most common configuration includes an IBM AS/400 running BROWNTech's application which is connected to, and communicating with, a PC WinNT/2000 network running office applications such as MSWord, Excel, email, etc.
- ⇒ **Imaging and Faxing** - The imaging module is tightly integrated with all system operations. Document images can be accessed for viewing, printing and faxing. View images side-by-side with index details. Print books from scanned documents. Write images to CD for microfilming or create your own microfilm using the Kodak Archive Writer.
- ⇒ **User Friendly** - Users can customize the system to meet the specific needs of each department. The staff can add/change document codes, fee rates, town codes, customer profiles, book codes, etc. "Variable prompts" improve data entry and public search accuracy by allowing the staff to assign field names that change according to document type.
- ⇒ **Integrated Remote Access** - Generate revenues by automatically tracking & billing remote users such as title examiners, attorneys and realtors. Grant access through standard communications software or through the Internet via a web browser. Print and/or fax images and research listings.
- ⇒ **Data Integrity and Audit Controls** - A Grantor / Grantee spell check function minimizes spelling errors. Automatic retrieval of Defendant & Plaintiff names. An audit trail tracks all changes made to critical data items for a document. Each audit record shows the initial value entered, what change was made, the date, time and person who made the change. Extensive copy and dupe key options help to reduce data entry errors and improve productivity.
- ⇒ **Document Recording** - The system can automatically assign and imprint each document with information such as the book, page, instrument number, recording date and time. This reduces errors and eliminates the need to manually hand stamp the documents. It also eliminates the need for Registry staff to key this information thus making your staff more productive. Bar codes and cover sheets can also be used as an alternative to imprinting each document.

IBM AS/400

- ⇒ **Reliability** - A Gartner Group study (Data: InformationWeek, May 18, 1998) showed the AS/400 server as experiencing an average outage of only 5.24 hours per year. This compared to 89.98 hours for Windows NT systems in the same study.
- ⇒ **Scalability** - AS/400 models range from the entry level systems, designed for small recording offices filing less than 20,000 documents per year, to large corporate systems with the processing power to handle millions of documents per year.
- ⇒ **Connectivity and OPEN design** - The IBM AS/400 offers a wide range of platform portability. The AS/400 also complies with industry standards such as SQL for databases, TCP/IP for open network and Internet connectivity, and standard TIFF image formats for easy optical conversions. Any Windows supported device, such as printers, scanners, modems, image capable workstations and fax systems are supported by the AS/400.
- ⇒ **Security** - AS/400 security is built to meet rigid Department of Defense standards (C-2).
